Recombinant antigen KMP11 for *Leishmania infantum*

**CATALOG NUMBER:** RAG0038

**RECOMBINANT ANTIGEN:** *Leishmania infantum* KMP11 (Passos et al., 2005).

**DESCRIPTION:** The recombinant antigen KMP11 for *Leishmania infantum* has been prepared as a recombinant antigen fused to a his-tag. It is produced from the complete ORF of the KMP11 gene which codes for the kinetoplast membrane protein 11.

**PRESENTATION:** liquid protein solution

**SOURCE:** *Escherichia coli*

**MOLECULAR WEIGHT:** determined by SDS-PAGE; the protein band is between molecular markers of 25,000 and 18,400 Da, while relative molecular mass calculated from amino acid sequence is 19,460.0 Da.

**BATCH COMPOSITION:**

<table>
<thead>
<tr>
<th>COMPONENTS</th>
<th>COMPOSITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>his-KMP11</td>
<td>recombinant antigen with a his-tag in its N-terminus</td>
</tr>
<tr>
<td>Storage buffer</td>
<td>20 mM phosphate buffer pH 8, 10 mM NaCl, 0.1% polyoxyethylene (10) tridecyl ether and 250 mM imidazole</td>
</tr>
</tbody>
</table>

**QUALITY CONTROL:**

1. **PROTEIN CONCENTRATION DETERMINED ESPECTROPHOTOMETRICALLY**

   \[
   D_{280} = 0.507 \\
   A_{0.1%} (\text{mg/l}) = 0.318 \\
   \text{CONCENTRATION*: 1.59 mg/ml}
   \]

   * The measurement of the protein concentration has been performed with the theoretical extinction coefficient of the recombinant protein obtained from Gill and von Hippel, 1989.

2. **PURITY CONTROL IN SDS-PAGE: 15%**

3. **TITRATION CURVE BY AN ELISA ASSAY**

   The titer has been suggested in reference to an "in-house" ELISA kit performed at Rekom Biotech over the first lot obtained.

   Each end user should carry out his own titration for his particular application.

   ![Titration Curve](image)

   **Figure 2.** In this plot, the optical density at 450/620 nm for positive (blue) and negative (gray) IgG sera are compared for each concentration of the recombinant antigen. An appropriate statistical test of significance for the comparison of means between both groups, the Welch's test, is employed. Eligible concentrations for the use of the antigen should present statistically significant differences between positive and negative sera. This happens when the intervals at the top do not overlap and, equivalently, when the p-value at the bottom is below 0.05. In the present figure, all p-values are below 0.05 and thus the intervals do not overlap. Therefore, any of the showed concentrations can be used to distinguish between positive and negative sera.

4. **ABSENCE OF PRECIPITATION AFTER A FREEZING AND THAWING CYCLE:** ok

**LOT SPECIFICATIONS:**

1. **CONCENTRATION:** 1.59 mg/ml
2. **TOTAL QUANTITY PER ALIQUOT:** 1 mg
3. **TOTAL VOLUME PER ALIQUOT** (5% overfill): 0.66 ml
4. **SUGGESTED TITER BY ELISA:** approx. 1/2800 which corresponds to 0.56 µg/ml of protein concentration in plates for IgG detection.
5. **STORAGE:** Protein is shipped with dry ice. Upon arrival, it should be aliquoted in order to avoid repeated freezing and thawing cycles and stored at -20ºC to -80ºC.
6. **APPLICATIONS:** ELISA, lateral flow and Western blot assays. Where this product has not been tested for use in a particular technique this does not necessarily exclude its use in such procedures. Suggested working dilutions are given as a guide only. It is recommended that the user titrates.
7. **OBSERVATIONS:** proteins should be maintained frozen at high concentrations. The dilution to be performed for...
ELISA assays should be made with a small quantity of protein, the same day of the experiment. In order to defrost the protein, maintain the aliquot at 25ºC without shaking to avoid aggregation. Prior making test dilutions and after defrost the protein, is recommended to remove possible protein aggregates by centrifuging the stock solution, avoiding alterations in the immobilization of the biomolecule to the solid surface.

**RELATED PRODUCTS:**

K39, K39-monobiot.

**BIBLIOGRAPHY:**

**Important Notes:**

During shipment, small volumes of product will occasionally become entrapped in the seal of the product vial. For products with volumes of 200 µl or less, we recommend gently tapping the vial on a hard surface or briefly centrifuging the vial in a tabletop centrifuge to dislodge any liquid in the containers cap.

Although recombinant antigens are expressed in a non-pathogenic *E. coli* and bacterial integrity is destroyed during purification, the antigen preparation should be handled as potentially infectious.

**NOT FOR DIAGNOSTIC USE, FOR RESEARCH USE ONLY**
